**The Science and Environmental Policy Project**

#####

**Quote of the Week:** *It is in the admission of ignorance and the admission of uncertainty that there is a hope for the continuous motion of human beings in some direction that doesn't get confined, permanently blocked, as it has so many times before in various periods in the history of man.* – Richard Feynman

#####

**Number of the Week:** \$5,000,000,000,000 per year

#####

**SEPP'S APRIL FOOLS AWARD**  
**THE JACKSON**

The voting for SEPP's annual April Fools Award is over. We thank all those who participated with nominees and votes. The winner of this close race will be announced at the 33<sup>rd</sup> Annual Meeting of the Doctors for Disaster Preparedness in Ontario, CA, from July 31 to August 2, 2015.

#####

**ICCC-10: *The debate over climate change is changing. Can you feel it?***

On June 11-12, 2015, at the Washington Court Hotel in Washington, D.C., The Heartland Institute of Chicago, Illinois will host its Tenth International Conference on Climate Change, titled The New Science & Economics of Climate Change. The program includes many of the leading spokespersons for sound science and economics, including Dr. Will Happer, Dr. Fred Singer, Dr. Willie Soon, Christopher Monckton, Dr. Bob Carter, Dr. Craig Idso, and Anthony Watts. For registration and more information see: <http://climateconference.heartland.org/>

#####

**THIS WEEK:**

***By Ken Haapala, President, Science and Environmental Policy Project (SEPP)***

**Climate and Health – Lancet:** The British medical journal Lancet released what is billed as the most comprehensive study on the relationship between temperature extremes and human mortality. According to the abstract: “Although studies have provided estimates of premature deaths attributable to either heat or cold in selected countries, none has so far offered a systematic assessment across the whole temperature range in populations exposed to different climates. We aimed to quantify the total mortality burden attributable to non-optimum ambient temperature, and the relative contributions from heat and cold and from moderate and extreme temperatures.”

*Methods: We collected data for 384 locations in Australia, Brazil, Canada, China, Italy, Japan, South Korea, Spain, Sweden, Taiwan, Thailand, UK, and USA. We fitted a standard time-series Poisson model for each location, controlling for trends and day of the week. We estimated temperature–mortality associations with a distributed lag non-linear model with 21 days of lag, and then pooled them in a multivariate metaregression that included country indicators and temperature average and range. We calculated attributable deaths for heat and cold, defined as temperatures above and below the optimum temperature, which corresponded to the point of minimum mortality, and for moderate and extreme temperatures, defined using cutoffs at the 2.5th and 97.5th temperature percentiles.*

*“Findings: We analysed 74 225 200 deaths in various periods between 1985 and 2012. In total, 7.71% (95% empirical CI 7.43–7.91) of mortality was attributable to non-optimum temperature in the selected countries within the study period, with substantial differences between countries, ranging from 3.37% (3.06 to 3.63) in Thailand to 11.00% (9.29 to 12.47) in China. The temperature percentile of minimum mortality varied from roughly the 60th percentile in tropical areas to about the 80–90th percentile in temperate regions. More temperature-attributable deaths were caused by cold (7.29%, 7.02–7.49) than by heat (0.42%, 0.39–0.44). Extreme cold and hot temperatures were responsible for 0.86% (0.84–0.87) of total mortality.*

*“Interpretation: Most of the temperature-related mortality burden was attributable to the contribution of cold. The effect of days of extreme temperature was substantially less than that attributable to milder but non-optimum weather. This evidence has important implications for the planning of public-health interventions to minimise the health consequences of adverse temperatures, and for predictions of future effect in climate-change scenarios.”*

The study was financed by the UK Medical Research Council.

These results (that about 20 times more deaths are associated with cold weather than hot weather) are not particularly surprising. For years independent scientists, such as those who participate in the Nongovernmental International Panel on Climate Change (NIPCC), have questioned mortality forecasts arising from the work presented by the UN Intergovernmental Panel on Climate Change (IPCC), and its claims of ever increasing temperatures.

The study focused on the temperate regions of the world, where most people live. Also of interest is that sub-optimal temperatures kill far more people than extreme temperatures. This indicates that the government focus on extreme events is misplaced. It is periods of cold or heat that should be the focus of public health officials.

No doubt, some Western governments are not pleased. They have placed enormous resources in “fighting global warming”, now called climate change due to the lack of 21<sup>st</sup> century warming. The study undermines the existence of many government programs and departments. Without the fear of increased mortality from global warming, taxpayers may begin to question those with political power, who exploit the fear of global warming/climate change. See links under Challenging the Orthodoxy

\*\*\*\*\*

**Climate and Health – USGCRP:** As discussed in the April 18 and May 16 TWTWs, the US Global Change Research Program (USGCRP) released a draft for public review of its upcoming Climate & Health Assessment. The entire document has significant issues, including it is based on forecasts from climate models that have not been validated and it ignores the importance of public health measures in controlling infectious diseases. The study published in Lancet, discussed above, exposes further weaknesses of the assessment by USGCRP.

Figure ES7 of the report gives an estimated ten year (2004 to 2013) fatalities from extreme weather events in the U.S, as prepared by the National Oceanic and Atmospheric Administration (NOAA), one of the thirteen government entities comprising the USGCRP. The ranking of estimated deaths over the 10 year period from the listed weather events are as follows: Heat Wave, a little greater than 1200; Tornado, about 1100; Hurricane, about 1100; Floods between 700 and 800; Wind Storm, about 500; Lightning between 350 and 400; Cold waves less than 250; and

Winter storms less than 250. The USGCRP findings on cold weather deaths are opposite to those in Lancet.

Those who have studied mortality tables for the US would recognize that the reported deaths from cold weather events make no sense – even before the publication of the Lancet report. Lightning kills more people in the US than Cold Waves or Winter Storms? The USGCRP and the thirteen government entities involved should immediately withdraw the report and publicly apologize for its publication, which, of course, will not happen. See links under Defending the Orthodoxy.

\*\*\*\*\*

**Respect:** Using a graduation ceremony of the U.S. Coast Guard Academy as the venue, President Obama asserted an “urgent need to combat and adapt to climate change.” There is no issue with the need to adapt to climate change, which has been ongoing for well over a billion years, long before the advent of multi-cell creatures, much less humanity.

In spite of spending at least twenty billion dollars on climate science, this Administration has not significantly advanced our knowledge of the natural influences on climate, as reflected in government publications, such as those by the USGCRP. In short, the Administration is demanding we fight an enemy without understanding it. Yet, one of the maxims of military strategy is: “Know your enemy.”

Given to those who are about to become military officers, trained to be respectful of the Commander in Chief, the speech was more fitting for a political fund-raising event. The President, and his aides, are apparently unaware that respect must be mutual. Such ceremonies should not be considered as political opportunities. See links under Defending the Orthodoxy.

\*\*\*\*\*

**Return of the Iris?** A 2001 hypothesis by Richard Lindzen, et al. is making its way back into the literature. The hypothesis was quickly dismissed by the authoritarian Climate Establishment, without being fully considered. The hypothesis suggests that there is a natural response in the atmosphere to a warming, whatever the cause, which reduces the warming – a negative feedback. Such a negative feedback would lessen fears of “run-away” global warming, etc.

The return of the Iris indicates that the Climate Establishment can no longer authoritatively dismiss hypotheses that are contrary to its own beliefs – an advancement in Climate Science. See links under Challenging the Orthodoxy – The Iris?

\*\*\*\*\*

**Flash-in-the-Pan – Missing Hot Spot Found?** Based on highly manipulated data, a paper published in Environmental Research letters asserted that its authors found the missing “hot spot” – an area centered over the tropics at about 10 km in which a warming trend, whatever the cause, is more pronounced than at the surface. [Note: this is different than the temperatures being greater than at the surface.] Like the original hot spot, declared in the IPCC Second Assessment Report, it appears that no one, other than the authors, can find this recently re-discovered hot spot.

What is amusing about the entire affair is that few in the Climate Establishment bothered to report that the “so-called” distinct human fingerprint was missing, at least, until it was re-discovered. Now, will it remain unnoticed and missing, again? See links under Challenging the Orthodoxy and Measurement Issues.

\*\*\*\*\*

**Number of the Week:** \$5,000,000,000,000 per year. In the march to Paris for the 2015 (the 21<sup>st</sup>) Conference of Parties (COP) of the UN Framework Convention on Climate Change (UNFCCC)

starting on November 30, the International Monetary Fund (IMF) used very creative accounting techniques to declare that fossil fuel subsidies amount to about \$5,000,000,000,000 per year.

Of course, there is no accounting of the enormous benefits fossil fuel use provide Western Civilization and humanity. These appear to be beyond the imaginative accounting capabilities of the IMF. See links Communicating Better to the Public – Make things up.

## ARTICLES:

Please note that articles not linked easily or summarized here are reproduced in the Articles Section of the full TWTW that can be found on the web site under the date of the TWTW.

### 1. Notable & Quotable: President Obama

‘Around the world, climate change increases the risk of instability and conflict.’

WSJ, May 20, 2015

<http://www.wsj.com/articles/notable-quotable-president-obama-1432161506>

From President Obama’s commencement address Wednesday at the Coast Guard Academy in New London, Conn.:

*Around the world, climate change increases the risk of instability and conflict. Rising seas are already swallowing low-lying lands, from Bangladesh to Pacific islands, forcing people from their homes. Caribbean islands and Central American coasts are vulnerable, as well. Globally, we could see a rise in climate change refugees. And I guarantee you the Coast Guard will have to respond. Elsewhere, more intense droughts will exacerbate shortages of water and food, increase competition for resources, and create the potential for mass migrations and new tensions. All of which is why the Pentagon calls climate change a “threat multiplier.”*

*Understand, climate change did not cause the conflicts we see around the world. Yet what we also know is that severe drought helped to create the instability in Nigeria that was exploited by the terrorist group Boko Haram. It’s now believed that drought and crop failures and high food prices helped fuel the early unrest in Syria, which descended into civil war in the heart of the Middle East. So, increasingly, our military and our combatant commands, our services—including the Coast Guard—will need to factor climate change into plans and operations, because you need to be ready.*

\*\*\*\*\*

### 2. The Real Denialism

“Climate change” has become an all-purpose excuse.

By James Taranto, WSJ, May 21, 2015

<http://www.wsj.com/articles/the-real-denialism-1432229947>

[SUMMARY: The author brings up some of the key points in the President’s address to graduates of the U.S. Coast Guard Academy, in asserting ““the urgent need to combat and adapt to climate change.”

*He rehearsed the litany of weather disasters supposedly caused by climate change: “more extreme storms,” “deeper droughts and longer wildfires,” flooding of streets in coastal cities. And he went further, blaming global warming for geopolitical problems:*

*Understand, climate change did not cause the conflicts we see around the world. Yet what we also know is that severe drought helped to create the instability in Nigeria that was exploited by the*

*terrorist group Boko Haram. It's now believed that drought and crop failures and high food prices helped fuel the early unrest in Syria, which descended into civil war in the heart of the Middle East. So, increasingly, our military and our combatant commands, our services—including the Coast Guard—will need to factor climate change into plans and operations, because you need to be ready.*

*Even if one assumes all these assertions are true, they do not advance a case for urgent action. As the president acknowledged with that initial disclaimer, the chain of causation is just too weak. Global climate change contributes somehow to local droughts, which contribute somehow to instability, which contributes somehow to the rise of Boko Haram and rebellion in Syria (a rebellion, let us recall, for which the president briefly urged U.S. military support back in 2013). The vagueness of the hypotheses make it impossible to evaluate any proposed climate policy as a remedy for the Nigerian or Syrian conflicts.*

*The most telling assertion in the president's speech was meant as a throwaway line. Immediately after setting up his some-folks-back-in-Washington straw man, Obama allowed as how "on a day like today, it's hard to get too worried about it," the antecedent being "climate change." It was a cool spring day in New London, Conn.*

*But of course he does not. As with the weather, he presents "climate change" as a cause of all manner of bad effects but no good ones. In the geopolitical realm, it is an all-purpose excuse when things go wrong. It is logically little different from saying of a disaster, whether natural or man-made, "It was God's will." That statement is true if one accepts the underlying metaphysical theory, and it may provide comfort to those who do. But it is not an empirical explanation. It isn't science.*

*Now of course weather isn't the same thing as climate, as global warmists are quick to point out in fair weather. But that's true of all weather. It is fallacious to attribute bad weather but not good weather to "climate change," as if every day was idyllic everywhere on preindustrial Earth.*

*Similarly, if "climate change" is contributing to war and instability, it must also be contributing to peace and stability. Obama boasts of various foreign-policy achievements, such as the "end of the war" in Iraq and the diplomatic openings to Iran and Cuba. Stipulating for the sake of argument that these are in fact favorable developments, the logic of the president's Coast Guard speech is that he must share the credit for them with all humans whose activities have contributed to climate change.*

*Obama's denunciation of those who persist in "denying" global warmism is especially objectionable in light of his own denialism with regard to Islamic extremism. As we noted last August, the president insisted that the Islamic State, which is among the combatants in the Syrian war, "speaks for no religion. . . . No faith teaches people to massacre innocents." Presumably he would say the same of Boko Haram (whose name means, roughly, "non-Islamic education violates Islamic law").*

\*\*\*\*\*

### **3. Schoolroom Climate Change Indoctrination**

In one assignment, students measure the size of their family's carbon footprint and suggest ways to shrink it.

By Paul Tice, WSJ, May 27, 2015 [H/t William Readdy]

<http://www.wsj.com/articles/schoolroom-climate-change-indoctrination-1432767611>

SUMMARY: After discussing the framework of kindergarten to 12<sup>th</sup> grade science education, approved by the National Research Council, the author discussed the ideological nature of the program: *“by the end of Grade 5, students should appreciate that rising average global temperatures will affect the lives of all humans and other organisms on the planet. By Grade 8, students should understand that the release of greenhouse gases from burning fossil fuels is a major factor in global warming. And by Grade 12, students should know that global climate models are very effective in modeling, predicting and managing the current and future impact of climate change.”*

Apparently, the Council is not bothered by the fact that temperatures have not been rising for over a decade, and there has been no empirical relationship established between atmospheric CO<sub>2</sub> and global temperatures. The National Oceanic and Atmospheric Administration and the Energy Department have their own Climate Literacy & Energy Awareness Network, or CLEAN.

According to the author: *Relying on a climate-change curriculum and teaching materials largely sourced from federal agencies—particularly those of the current ideologically driven administration—raises a number of issues. Along with the undue authoritative weight that such government-produced documents carry in the classroom, most of the work is one-sided and presented in categorical terms, leaving no room for a balanced discussion. Moreover, too much blind trust is placed in the predictive power of long-range computer simulations, despite the weak forecasting track record of most climate models to date.*

*This is unfortunate because the topic of man-made global warming, properly taught, would present many teachable moments and provide an example of the scientific method in action. Precisely because the science of climate change is still just a theory, discussion would help to build student skills in critical thinking, argumentation and reasoning, which is the stated objective of the new K-12 science standards.*

*For instance: Why has the planet inconveniently stopped warming since the late 1990s even as carbon dioxide levels have continued to rise? How reliable are historical measurements of average global temperatures and atmospheric carbon dioxide levels when, before the 1950s, much of the data are interpolated from such diverse sources as weather balloons, kites, cloud observations, primordial tree rings and Antarctic ice bubbles?*

*How statistically significant is a 1.4-degree Fahrenheit increase in average global surface temperatures since 1880 for a 4.6 billion-year-old planet with multiple ecosystems and a surface area of some 200 million square miles? How dangerous is the current level of carbon dioxide in the world’s atmosphere, when 400 parts per million expressed as a percentage of the volume of the atmosphere would equate to only 0.04% or approximately zero?*

*Employing such a Socratic approach to teaching climate change would likely lead to a rational and thought-provoking classroom debate on the merits of the case. However, that is not the point of this academic exercise—which seems to be to indoctrinate young people by using K-12 educators to establish the same positive political feedback loop around global warming that has existed between the federal government and the nation’s colleges and universities for the past two decades.*

\*\*\*\*\*

#### **4. Slaking California’s Thirst—if Politics Allows**

Israel solved its water woes in five years by desalination. A CEO explains why it took him 10 years to build a single plant near San Diego.

By Allysia Finley, WSJ, May 15, 2015

<http://www.wsj.com/articles/slaking-californias-thirstif-politics-allows-1431729692>

SUMMARY: The author compares the water situation in southern California with that of Israel, which, by the end of the year will complete “three massive desalination plants in Ashdod, Hadera and Sorek that combined are capable of producing 100 billion gallons of potable water each year from the sea. More such projects are in the works. Next year desalination will provide about half of Israel’s water—not including the roughly 80% of recycled wastewater that goes mainly to agriculture—up from zero in 2004 and about 10% in 2009. The drought ended in 2012, and Israel doesn’t need to worry much about the next one. In a mere five years, desalination has turned a scarce resource into a commodity that may soon be exportable.”

The bureaucratic effort in California is going to cutting consumption, and environmental groups are fighting efforts to build addition desalination plants, even as first plant in Carlsbad is nearing completion.

### **5. The Hole in the Rooftop Solar-Panel Craze**

Large-scale plants make sense, but panels for houses simply transfer wealth from average electric customers.

By Brian Potts, WSJ, May 17, 2015

<http://www.wsj.com/articles/the-hole-in-the-rooftop-solar-panel-craze-1431899563>

Link to report: Going Solar in America: Ranking Solar’s Value to Consumers in America’s Largest Cities

By Jim Kennerly and Autumn Proudlove, NC Clean Energy Technology, No date

[http://nccleantech.ncsu.edu/wp-content/uploads/Going-Solar-in-America-Ranking-Solars-Value-to-Customers\\_FINAL.pdf](http://nccleantech.ncsu.edu/wp-content/uploads/Going-Solar-in-America-Ranking-Solars-Value-to-Customers_FINAL.pdf)

SUMMARY: The author asserts that” Large-scale solar-power prices are falling because the cost to manufacture solar panels has been decreasing and because large solar installations permit economies of scale. Rooftop solar, on the other hand, often involves microinstallations in inefficient places, which makes the overall cost as much as 3½ times higher.”

The reasons for these inefficiencies are multiple, but “well-meaning—but ill-conceived—federal, state and local tax incentives for rooftop solar give back between 30% and 40% of the installation costs to the owner as a tax credit. But more problematic are hidden rate subsidies, the most significant of which is called net metering, which is available in 44 states. Net metering allows solar-system owners to offset on a one-for-one basis the energy they receive from the electric grid with the solar power they generate on their roof.”

*“Increasingly, utilities across the country have been calling attention to the problems with rooftop solar. They’ve been urging the pursuit of large-scale solar and other renewables, the moderation of rooftop-solar subsidies, and a restructuring of electric rates to encourage new technologies. They’ve been vilified by armies of PR consultants armed with sound bites about how utilities want to kill solar.”*

The cited study, financed by the Department of Energy, claims that in 46 of America’s 50 largest cities, a typically sized solar PV system is a better investment than the stock market. The rating

system used in the study ranks New York City and Boston as # 1 and #2 in the US as places to “invest in” solar PV, well ahead far sunnier Oklahoma City (# 48) and Tulsa, OK, (# 49).
