

# The Week That Was: 2013-06-29 (June 29, 2013)

## Brought to You by SEPP ([www.SEPP.org](http://www.SEPP.org))

### The Science and Environmental Policy Project

---

**Quote of the Week:** : "The influence of mankind on climate is trivially true and numerically insignificant." Richard Lindzen [H/t Tom Sheehan]

**Number of the Week:** 3.7%

**THIS WEEK:**

**By Ken Haapala, Executive Vice President, Science and Environmental Policy Project (SEPP)**

**The Climate Speech:** President Obama gave a long awaited speech announcing his climate plan. In an emotional appeal, he invoked the spirit of Apollo missions, apparently unaware that some of the veterans of the Apollo team formed The Right Climate Stuff research team (TRCS) that directly challenges the claims of the official Washington science that human emissions of carbon dioxide are causing dangerous global warming. The research team found that 1) the science that predicts the extent of Anthropogenic Global Warming (AGW) is not settled; 2) there is no convincing physical evidence of Catastrophic AGW; 3) computer models need to be validated before being used in critical decision-making, 4) we have time to study global climate changes and improve our prediction accuracy, 5) the US government is over-reacting to AGW, and 6) a wider range of solution options should be studied for global warming or cooling threats from any credible cause.

The president announced sweeping new powers for the EPA, including regulating existing coal fired power plants, without bothering to ask Congress for the requisite legislation. In so doing he is claiming authoritarian powers to fight climate change which has been ongoing for hundreds of millions of years.

The president used the term carbon pollution some 20 times, demonstrating how the unfortunate Supreme Court decision that carbon dioxide is a pollutant that can be regulated under the Clean Air Act has infected official thinking in Washington. Many do not realize they are carbon based life forms and that in the act of breathing they increase the concentration of carbon dioxide (CO<sub>2</sub>) of the air they use by 100 times, inhaling 4 parts per 10,000 and exhaling 400 parts per 10,000. In his speech the president lumped carbon with mercury, sulfur, and arsenic, known toxins.

The speech contained numerous scientific and factual challenges. But this is official Washington science, where un-validated computer models are used to create fear of the future, including global warming, climate change, and extreme weather events, as if they had never happened before. The official science is grossly misleading and, contrary to the models, atmospheric warming stopped a decade ago, and surface warming stopped over 15 years ago. The official science is creating fear in the public that natural variability in climate is unusual and that variability can be controlled by government.

The president presented the issue as if he was on high moral ground, equating skeptics to members of the Flat Earth Society and insisted that urgent action is needed to protect future generations. If there is any moral issue to the speech, it is misleading the public about science and public health to assert authorities control over significant components of the economy.

Unfortunately, if his plan is implemented, the major burdens will become evident long after he has left office. Please see Article #2, links under President Obama's Climate Speech and <http://www.therightclimatestuff.com/SummaryPrelimReport.html>. The articles cover a wide range of opinion, and they are in no particular order. Generally, the newspapers that identify themselves as liberal supported the president's authoritarian expansion of power and did not insist on legislative action.

\*\*\*\*\*

**Carbon, Cost or Benefit?** Last week's TWTW discussed how the concept of Social Cost of Carbon, which has never been approved by Congress, therefore is an authoritarian assertion, is being manipulated by Washington bureaucrats. An article in the *Wall Street Journal*, discusses this further. TWTW will start a subheading titled the Social Benefits of Carbon. Please Article #3 and Social Benefits of Carbon.

\*\*\*\*\*

**Another Yucca Mountain?** Secretary of Energy Moniz asserted that the Administration is not waging a war on coal and that the Climate Plan has \$8 Billion for carbon capture and storage. Those who believe this will become effective and affordable would do well to review the history of the Yucca Mountain Nuclear Waste Repository, which this Administration stopped, costing the nuclear energy tens of billions on a failed government promise. In 2009, the EPA issued a rule limiting the radiation doses from Yucca Mountain for up to 1,000,000 years!

Further, the requirement under the climate plan that the EPA will issue CO2 limits for new plants and existing plants achieves the goal of stopping construction of new coal-fired power plants to replace less efficient older plants. No one would start a plant under the cloud of new regulations to be issued later. Please see link under Energy Issues – US.

\*\*\*\*\*

**Flat Earth Society:** President Obama's equating those skeptical of the Washington science that CO2 emissions cause dangerous global warming brought out a few amusing responses with the Flat Earth Society. It turns out that the president of the society believes official climate science. Luboš Motl has fun with this by suggesting a merger of the UN Intergovernmental Panel on Climate Change (IPCC) and the Flat Earth Society. Please see link under Questioning the Orthodoxy.

\*\*\*\*\*

**NIPCC in China:** There are further press releases covering the Chinese Academy of Sciences announcing the translation of the two major reports by the Nongovernmental International Panel on Climate Change (NIPCC) and the event surrounding the announcement. The purpose translation was to promote discussion and it was not an endorsement of the report. Please see Article # 1 and links under NIPCC in China.

\*\*\*\*\*

**Model Issues:** Last week's TWTW contained a discussion on the meaning of the mean of an ensemble of models. Judith Curry presented a discussion, limited to weather models that are constantly tested and updated. For the technically inclined please see link under Model Issues.

\*\*\*\*\*

**A Political Shift:** Judith Curry suggests that the response of the Republicans to the President's climate plan may indicate a shift in policy from questioning the science to focusing on the costs of the plan. Curry endorses this approach.

This approach may be easier to explain to the general public. But the quality of the science still needs to be addressed. As discussed in last week's TWTW, the FY 2012 U.S. Global Change Research Program (USGCRP) is \$2.6 Billion. This does not include the monies being spent by the 13 agencies that make up the program. The 2009 USGCRP (different name) report was misleading. The draft 2013 report was shoddy, at best. If the purpose is to learn about climate change, rather than creating illusionary models, the entire program must be turned around to first understand the natural causes of climate change – and then understand the human influence. This turn around can only be accomplished sharp questioning of all the agencies involved. Please see link under The Political Games Continue.

\*\*\*\*\*

**Fracking Fears:** A new study by Robert Jackson, Professor of Environmental Science at Duke, confirmed that some water wells in northeastern Pennsylvania in Marcellus shale basin showed high concentrations of methane, ethane and propane. But according to Jackson, the likely cause was faulty well construction, improper sealing; not hydraulic fracturing. Please see link under Oil Spills, Gas Leaks & Consequences

\*\*\*\*\*

**Gas Rich Britain?** The UK Geological Survey released a study of northern England that indicates that the Bowland shale basin may contain the largest amount of shale gas in the world, up to 1300 trillion cubic feet. Of course much more exploration is necessary to determine how much is economically recoverable. The discovery will cause great consternation among the no fossil fuels politicians. Please see links under Oil and Natural Gas – the Future or the Past?

\*\*\*\*\*

**Climate Science Lesson Plans:** The International Climate Science Coalition has announced lesson plans for teaching climate science in middle and high schools. SEPP has not reviewed the plans, but is familiar with the science advisor, Bob Carter, who is an editor of the NIPCC reports, and, no doubt, the program is scientifically sound. Please see link under Questioning the Orthodoxy.

\*\*\*\*\*

**Sustainable Wind Power?** Probably unintentionally, an article in the Guardian newspaper stated: "Wind turbine operators and manufacturers have been holding off on tens of billions of pounds of investment in the UK, over fears that subsidies would be cut to unsustainable levels." SEPP has long maintained that without subsidies wind and solar power are unsustainable on a commercial scale. Please see link under Subsidies and Mandates Forever.

\*\*\*\*\*

**Amplifications and Corrections:** Harold Doiron of The Right Climate Stuff Team corrected TWTW description of his work on the Apollo program. It should have read: "He developed the lunar lander touchdown dynamics simulation for toppling stability and energy absorption used to guide design of the landing gear, develop landing techniques, and help select safe landing sites."

Reader Jens Kieffer-Olsen challenges David Archibald's hypothesis that temperatures from central England indicate we are two years away from a 1740 event which was one of extreme cold following a period of warmth. Kieffer-Olsen asserts that the cause of the event was the 1739 eruption of Mt. Hekla in Iceland which killed about 20% of the population. An internet search, including one by Anthony Watts failed to uncover such an eruption. Kieffer-Olsen provided an account written in 1914, but it is in Swedish. The google translations is poor but it does state the eruption killed 9,238 people and significant livestock. <http://runeberg.org/univers/0476.html> In two years we can test Archibald's hypothesis.

\*\*\*\*\*

**Number of the Week:** 3.7%. That is the percentage in US carbon dioxide emissions from 2011 to 2012, according to the Energy Information Administration. Except for 2010, emissions have dropped every year since 2007. Lower natural gas prices have resulted in less carbon-intensive natural gas electricity generation replacing higher carbon intensive coal generation. The mild winter contributed as well. SEPP adds that the sustained economic stagnation (growth rate less than 2%) contributes as well.

**JCU caves in to badgering and groupthink — blackballs “politically incorrect” Bob Carter**

By Jo Nova, Her Blog, Jun 26, 2013

<http://joannenova.com.au/2013/06/jcu-caves-in-to-badgering-and-groupthink-blackballs-politically-incorrect-bob-carter/>

*[SEPP Comment: Bob Carter is an editor of the NIPCC Reports.]*

### ***Challenging the Orthodoxy***

**Roy Spencer and Murry Salby,**

By Vincent Gray, NZ Climate Truth Newsletter No 313, Jun 22, 2013

<http://theclimatescepticsparty.blogspot.com.au/2013/06/roy-spencer-and-murry-salby.html>

*[SEPP Comment: On the importance of satellite measurements temperatures. Also, on the need to document findings so they can be carefully studied, in this instance the relationship between temperatures and CO<sub>2</sub> as asserted by Salby.]*

### **Government Weather and Climate Science is a Proven Disaster.**

By Tim Ball, A Different Perspective, Jun 26, 2013

<http://drtimball.com/2013/government-weather-and-climate-science-is-a-proven-disaster/>

It is time to close the [UK] weather office as they, like all government weather offices, have proved are political, unaccountable and scientifically wrong.

### **Paper finds ~50% of warming over past 30 years was due to natural ocean oscillations**

By Staff Writer, Hockey Schtick, Jun 18, 2013

<http://hockeyschtick.blogspot.com/2013/06/paper-finds-50-of-warming-over-past-30.html>

Link to paper: An Observational Analysis of Oceanic and Atmospheric Structure of Global-Scale Multidecadal Variability

By Peng Liu, Taida Institute for Mathematical Sciences, Sep 18, 2013

[http://www.tims.ntu.edu.tw/Talks\\_detail.php?talkID=2301](http://www.tims.ntu.edu.tw/Talks_detail.php?talkID=2301)

*[SEPP Comment: Solar influence should not be summed with ocean influence, they may be interrelated.]*

### ***Defending the Orthodoxy***

**Goodbye, Miami**

By century's end, rising sea levels will turn the nation's urban fantasyland into an American Atlantis. But long before the city is completely underwater, chaos will begin

By Jeff Goodell, Rolling Stones, Jun 20, 2013 [H/t William Readdy]

<http://www.rollingstone.com/politics/news/why-the-city-of-miami-is-doomed-to-drown-20130620>

[SEPP Comment: A tedious account of what may happen. During the last interglacial, about 125,000 years ago, south Florida was covered by the ocean. One can see this by investigating limestone quarries 2 to 3 meters above sea level. No one suggests that human CO<sub>2</sub> emissions was the cause.]

## **Buffering the Sun**

David Keith and the question of climate engineering

By Erin O'Donnell, Harvard Magazine, July / August, 2013 [H/t Jan Breslow]

[http://harvardmagazine.com/2013/07/buffering-the-sun?utm\\_source=University&utm\\_medium=email&utm\\_campaign=EdHighlights\\_Jun13](http://harvardmagazine.com/2013/07/buffering-the-sun?utm_source=University&utm_medium=email&utm_campaign=EdHighlights_Jun13)

## **President Obama's Climate Speech**

[SEPP Comment: A model trajectory is not necessarily indicative of what may occur.]

### ***Review of Recent Scientific Articles by NIPCC***

***For a full list of articles see [www.NIPCCreport.org](http://www.NIPCCreport.org)***

#### **Modeling Climate Feedbacks Based on Short-Term Climate Variations**

Reference: Koumoutsaris, S. 2013. What can we learn about climate feedbacks from short-term climate variations? *Tellus A* 65: 10.3402/tellusa.v65i0.18887

<http://nipccreport.org/articles/2013/jun/25jun2013a1.html>

Koumoutsaris concludes that his several analyses indicate that "important aspects of the ENSO variability are still poorly understood and/or simulated." And in the case of cloud feedback, he says that it is difficult to come to "any firm conclusion" ... even on the *sign* of the feedback. And when these phenomena are so *poorly simulated*- even to the point where the direction of change of one of them remains unknown - it should be clear to all that the climate-modeling enterprise

still has a long, long way to go before it can be considered good enough to serve as a basis for energy policy decisions that are *already* dictating various aspects of human behavior.

### **How Southern Ocean Echinoderm Larvae Respond to Elevated CO<sub>2</sub>**

Reference: Yu, P.C., Sewell, M.A., Matson, P.G., Rivest, E.B., Kapsenberg, L. and Hofmann, G.E. 2013. Growth attenuation with developmental schedule progression in embryos and early larvae of *Sterechinus neumayeri* raised under elevated CO<sub>2</sub>. *PLOS ONE* 8: e52448.

<http://nipccreport.org/articles/2013/jun/25jun2013a2.html>

After all was said and done, Yu et al. concluded, in the final sentence of their paper's abstract, that "effects of elevated CO<sub>2</sub> representative of near future climate scenarios are proportionally minor on these early development stages."

### **Recent Antarctic Sea Ice Extent in CMIP5 Models**

Reference: Turner, J., Bracegirdle, T.J., Phillips, T., Marshall, G.J. and Hosking, J.S. 2013. An initial assessment of Antarctic sea ice extent in the CMIP5 models. *Journal of Climate* 26: 1473-1484.

<http://nipccreport.org/articles/2013/jun/25jun2013a3.html>

In summing up their findings, Turner et al. conclude that "many of the SIE biases in the CMIP3 runs remain in CMIP5." More particularly, for example, they state that "as with CMIP3, the models do not simulate the recent increase in Antarctic SIE observed in the satellite data."

### **Seven Millennia of Hurricane Activity along the Coast of Belize**

Reference: McCloskey, T.A. and Liu, K.-b. 2012. A 7000 year record of paleohurricane activity from a coastal wetland in Belize. *The Holocene* 23: 278-291.

<http://nipccreport.org/articles/2013/jun/26jun2013a2.html>

In light of these diverse findings, McCloskey and Liu conclude that (1) "both the climatic conditions favoring tropical cyclones and the frequency of landfall for major hurricanes have exhibited multi-centennial variability over the late Holocene," and that (2) "the timing of hyperactive periods varies regionally across the North Atlantic." Hence, their work would appear to suggest that there are no hard-and-fast rules about how climate change may impact the development of future storms in these regions.

### ***Alternative, Green ("Clean") Solar and Wind***

#### **To cut pollution, install green power in the coal belt**

Pricing to air pollution suggests solar is more profitable in Ohio than Arizona.

By Kate Prengaman, Ars Technica, Jun 25, 2013

<http://arstechnica.com/science/2013/06/to-cut-pollution-install-green-power-in-the-coal-belt-researchers-say/>

Link to paper: Regional variations in the health, environmental, and climate benefits of wind and solar generation

By Siler-Evans, et al., PNAS, May 15, 2013

<http://www.pnas.org/content/early/2013/06/19/1221978110.abstract>

*[SEPP Director Tom Sheahen points out the ignorance in this article including: "Basically, if you install a solar array in the sunny Southern California desert, that power mostly replaces electricity made with relatively clean natural gas. In contrast, if you installed the same solar panels in considerably less sunny Ohio, you'd be primarily replacing capacity at a coal-burning power plant, reducing far more air pollutants than in California."*

*A) the capital cost of a solar panel is the same in either place, and Ohio is "considerably less sunny", so you'd get less energy out, and hence it takes longer to get your money back.*

*B) when electricity enters the grid, the distance to where it gets used is a minor factor. I know that seems counter-intuitive, but the majority of the losses in transmission and distribution are due to transformers, not due to the  $I^2R$  loss associated with wire length.*

*C) the image of electricity moving from one point to another like water in a pipe is straight out of junior-high science class, and doesn't explain AC power transmission. There is an entire industry/enterprise/business called "wheeling" about moving power around the grid at different times. Quickly summarizing, the grid loses 8% of the energy (and 10% of the power), regardless of where power enters or is taken off."]*

## **Europe's Renewables Hype Implodes As German Solar Goes Belly Up**

## **ARTICLES:**

### **1 Climate change by the numbers.**

By S. Fred Singer, Chairman of SEPP, Founder of NIPCC, Submitted to *Shanghai Daily*, June 23, 2013

<http://www.sepp.org/science-editorials.cfm#A83>

In his *Shanghai Daily* essay of June 19, Mr. Bob Ward, a publicist with the Grantham Research Institute (London), promotes an alarmist view of climate change. He presents the conclusions of the IPCC, which claims that human-caused emission of greenhouse gases, like carbon dioxide from the burning of fossil fuels (coal, oil, and gas), is producing dangerous global warming.

The IPCC [Intergovernmental Panel on Climate Change] was set up by the United Nations to provide the necessary evidence to support the (Rio de Janeiro) Global Climate Treaty, signed by most nations. This 1992 Treaty resulted in the Kyoto Protocol of 1997, which was supposed to reduce the CO<sub>2</sub> content of the atmosphere. It has failed completely in its task; by now, CO<sub>2</sub> has risen to 400 ppm, about 40% above the pre-industrial level. The Protocol expired in 2012; but activists want to set up another one. However, there is little enthusiasm for any such agreement to limit energy production and economic growth.

The IPCC is supposed to survey published scientific results impartially but instead it has ignored research papers that contradict its conclusion. For evidence of human influence on climate, the IPCC relies on a supposed agreement between climate models and observations. In fact, the models cannot reproduce most of the observations and therefore fail to support the IPCC conclusion.

This disagreement has now become apparent to many scientists around the world, who have set up a competing study group called NIPCC [Non-Governmental International Panel on Climate Change]. The Chinese Academy of Sciences has just translated and published the reports of the NIPCC. The CAS also organized a June 15 Workshop in Beijing, where an international group of NIPCC authors presented their results.

Contrary to the IPCC, NIPCC finds that natural influences rule the climate and human influences are relatively insignificant. I will give several examples where models and observations disagree.

Bob Ward mentions in passing that there has been no warming observed in the last fifteen years. But he fails to point out that this result disagrees with the predictions of every climate model.

Ward is also dismissive of scientific research that cosmic rays from outer space can and do change the climate. The full story is that the cosmic ray intensity is affected by solar activity. Ultimately therefore, solar activity affects cosmic rays, which in turn change the earth's cloud cover and thereby affect climate.

One could cite many other examples of credible scientific work ignored by the IPCC. It has been the aim of the NIPCC to restore the balance of evidence necessary to permit informed decisions on policy.

Bob Ward relates, with pride, that the IPCC's Summary for Policy Makers is approved line-by-line by the nearly 200 participating national delegations. But these delegates are not scientists; they are working with a draft carefully compiled by a handful of politically oriented scientists who "cherry-pick" evidence from the IPCC Report itself and ignore contrary evidence. Unlike the Report, this draft Summary does not acknowledge the existence of scientific uncertainties.

It is on the basis of such a Summary that politicians then try to develop policies that affect energy use -- and therefore have tremendous economic consequences. Right now, China is beginning to experiment with "cap-and-trade" policies. The US Congress has refused to approve such a policy; yet President Obama will attempt to achieve a similar result through regulation – without the Congress. Europeans have tried it, but it has been an economic disaster. Australia has instituted a carbon tax as an alternative, but will soon abandon it. Only the State of California is proceeding with such a scheme, but is using it primarily to raise revenues, like a tax. It will have no detectable effect on climate.

A "cap and trade" scheme in China may have some value in improving energy efficiency – in reducing the amount of energy required to produce a unit of output. That would be a useful objective. But it will do little if anything for the global climate and should not be considered as climate policy.

A quick word about carbon dioxide: It is an odorless, non-toxic natural constituent of the Earth's atmosphere. As the basic food for all plants, it is absolutely essential for maintaining life on our planet. CO<sub>2</sub> should not be called a "pollutant." In the geological past, its level has been ten times or more higher than its present value; in fact, our major food crops developed when CO<sub>2</sub> levels were about five times higher. China is now the world's largest emitter of CO<sub>2</sub> and thereby making an important contribution to increasing agricultural yields at a time when much of the global population is still hungry. The world should be grateful to China.

## **2. The Carbonated President**

Obama unveils a war on fossil fuels he never disclosed as a candidate.

Editorial, WSJ, Jun 26, 2013

[http://online.wsj.com/article/SB10001424127887323683504578567533647032380.html?mod=IT\\_P\\_opinion\\_2](http://online.wsj.com/article/SB10001424127887323683504578567533647032380.html?mod=IT_P_opinion_2)

President Obama's climate speech on Tuesday was grandiose even for him, but its surreal nature was its particular hallmark. Some 12 million Americans still can't find work, real wages have fallen for five years, three-fourths of Americans now live paycheck to check, and the economy continues to plod along four years into a quasi-recovery. But there was the President in tony Georgetown, threatening more energy taxes and mandates that will ensure fewer jobs, still lower incomes and slower growth.

Mr. Obama's "climate action plan" adds up to one of the most extensive reorganizations of the U.S. economy since the 1930s, imposed through administrative fiat and raw executive power. He wants to reduce greenhouse gas emissions by 17% by 2020, but over his 6,500-word address he articulated no such goal for the unemployment rate or GDP.

The plan covers everything from new efficiency standards for home appliances to new fuel mileage rules for heavy-duty trucks to new subsidies for wind farms, but the most consequential changes would slam the U.S. electric industry. These plants, coal-fired power in particular, account for about a third of domestic greenhouse gases.

Last year the Environmental Protection Agency released "new source performance standard" regulations that are effectively a moratorium on new coal plants. The EPA denied that similar rules would ever apply to the existing fleet, or even that they were working up such rules. Now Mr. Obama will unleash his carbon central planners on current plants.

Coal accounted for more than half of U.S. electric generation as recently as 2008 but plunged to a mere 37% in 2012. In part this tumble has been due to cheap natural gas, but now the EPA will finish the job and take coal to 0%.

Daniel Shrag of Harvard, an Obama science adviser, told the New York Times Monday that "Politically, the White House is hesitant to say they're having a war on coal. On the other hand, a war on coal is exactly what's needed." At least he's honest, though in truth Mr. Obama's target is all forms of carbon energy. Natural gas is next.

The higher costs will ripple through the energy chain, which is precisely Mr. Obama's goal. Only by artificially raising the cost of carbon energy can he make even heavily subsidized "renewables" competitive.

In general every \$1 billion spent complying with an EPA rule threatens 16,000 jobs and cuts GDP by \$1.2 billion—and the agency is now writing scores of multibillion-dollar rules. Keep in mind that last month the Administration quietly raised the "social cost" of carbon by 60% in a regulatory filing related to microwave ovens. That means the EPA can jack up costs by 59.99% and still justify them by claiming the higher benefits.

This regressive burden won't merely be borne by average American consumers and utility rate-payers—especially in the Midwest and Southern regions that use the most coal. This also threatens one of the few booming parts of the economy, the energy revolution driven by shale gas and unconventional oil. The return of manufacturing to the U.S. depends on this cheap abundant energy, and it could as easily re-locate overseas as the U.S. becomes less competitive.

For good measure, Mr. Obama also declared that he will approve the Keystone XL pipeline "only if this project does not significantly exacerbate the problem of carbon pollution." Yet the oil in Alberta won't stay in the ground if Mr. Obama blocks the route to the Gulf of Mexico. It will be shipped by rail and boat to China and elsewhere. The only question is whether America will benefit from this shovel-ready project that will create tens of thousands of jobs.

Speaking of futility, Mr. Obama's ambitions will have no effect on global atmospheric carbon concentrations. Emissions are already falling in the U.S., thanks primarily to the shale gas boom, but emissions are rising in the developing world. Mr. Obama pandered to the climate-change absolutists by saying "We don't have time for a meeting of the Flat Earth Society." But he never explained how his plan will reduce warming, or why climate models have failed to predict the

warming slowdown of the last dozen or so years even as more CO<sub>2</sub> is pumped into the atmosphere.

Most striking about this Obama legacy project is its contempt for democratic consent. Congress has consistently rejected an Obama-style "comprehensive" anticarbon energy plan. That was true even when Democrats ran the Senate with a filibuster-proof majority in 2009-2010 and killed his cap-and-trade energy bill. The only legislative justification for Mr. Obama's new plan is an abusive interpretation of the Clean Air Act, which was last revised in 1990 and never mentions carbon as a pollutant.

So instead Mr. Obama will impose these inherently political policy choices via unaccountable bureaucracies, with little or no debate. Mr. Obama might have at least announced his war on carbon before the election and let voters have a say. Instead he posed as the John the Baptist of fossil fuels in locales such as Ohio, Pennsylvania and Virginia—taking credit for the shale fracking boom he had nothing to do with and running ads attacking Mitt Romney as anticoal.

Now safely re-elected, Mr. Obama figures he can do what he pleases. The Americans who will be harmed will have to console themselves with 99 weeks of jobless benefits, food stamps and ObamaCare.

### **3. The 'Social Cost of Carbon' Gambit**

Editorial, WSJ, Jun 27, 2013

[http://online.wsj.com/article/SB10001424127887323566804578551672709633396.html?mod=djemEditorialPage\\_h](http://online.wsj.com/article/SB10001424127887323566804578551672709633396.html?mod=djemEditorialPage_h)

President Obama unveiled his vast new anticarbon-energy agenda this week, which he plans to impose by executive fiat. Crucial to pulling off this exercise is a decision the federal bureaucracy made last month to change the way it accounts for carbon emissions—a decision that received almost no media attention.

In late May the Administration slipped this mickey into a new rule about efficiency standards for microwaves, significantly raising what it calls the "social cost of carbon." Team Obama made no public notice and invited no comment on this change that will further tilt rule-making against products and industries that use carbon energy.

Federal law requires the government to calculate the costs and benefits of its rules and projects. The regulatory agencies are expert at rigging these calculations, but even they haven't been able to hide the enormous costs of President Obama's regulations under traditional economic measurement. The Administration's solution? Simply redefine the economic and social "benefits" of reducing carbon.

And sure enough, in 2010 an interagency working group conjured a new way to goose the benefits of regulation. Every metric ton of carbon that was reduced by regulation would suddenly count for \$21 in "social benefits." This figure was derived by guesses about how more carbon in the atmosphere may harm everything from agricultural productivity to human health to flood risks. The government's previous official estimate? \$0.

The Administration has now gone further as part of its microwave rule and raised its estimated benefit from carbon reduction to about \$36 a metric ton. The Department of Energy explained that this "update" was the result of new assumptions based on "the best available science," which means whatever science the feds decide to favor. The practical effect is to further inflate the supposed benefit of new rules, thereby offsetting the enormous economic costs.

All of this was neatly illustrated in a 2011 paper by Michael Greenstone, a former White House economist, who helped to dream up the initial 2010 figure. Mr. Greenstone analyzed the Administration's new fuel-efficiency standards and admitted that under traditional economic analysis they were a net loser. They'd cost industry and consumers \$350 billion, while providing benefits (less pollution, more energy security and less congestion) of only \$277 billion. Yet conjure up another \$177 billion in supposed new social benefits from less carbon, and—voila!—the costs of the new rule would be more than offset.

All of this is prelude to the coming regulatory onslaught on carbon energy and electricity production. The social-cost gambit will allow the Administration to claim an enormous economic benefit for any greenhouse gas regulation that reduces carbon—such as new standards on existing coal plants (new plants are already being regulated out of existence), oil refineries or lawn mowers.

This will also help to disguise the net cost of these rules in lost jobs, higher energy prices and less consumer choice. The new social-cost calculation could also be used against projects like the Keystone XL pipeline, claiming they impose too high a "social cost" by assisting the production of carbon energy to justify approval.

Republicans are slowly figuring out what's going on here, and Senator David Vitter of Louisiana has sent a letter to the EPA, Energy Department and White House budget office demanding the details of its social-cost modeling.

Laurie Johnson, chief economist for climate at the Natural Resources Defense Council, says the social cost of carbon ought to be as high as \$266 a metric ton. If the cost can be whatever some regulator claims, based on pressure from some green outfit or competing energy lobby, the government has the power to put any fossil-fuel industry out of business whenever it feels like it.

All of this is profoundly undemocratic. Congress has never legislated that there are social costs to carbon emissions, much less how to measure them. Mr. Obama couldn't pass his anticarbon agenda through Congress in his first two years even with a Democratic supermajority. He's now trying to impose it by regulation, and to do so he's rigging the rule-making with inventions like the "social cost of carbon." Someone needs to impose a political cost on Mr. Obama's arbitrary rule by regulation.

#### **4. A Property Rights Victory**

Government can't use permitting to extort from landowners.

Editorial, WSJ, Jun 27, 2013

[http://online.wsj.com/article/SB10001424127887323683504578567670559475816.html?mod=WSJ\\_Opinion\\_AboveLEFTTop](http://online.wsj.com/article/SB10001424127887323683504578567670559475816.html?mod=WSJ_Opinion_AboveLEFTTop)

Property rights don't always get the respect they deserve at the Supreme Court, but this year has been different. On Tuesday the Justices delivered their third rebuke of the term against government abuse of the Constitution's Takings Clause in *Koontz v. St. Johns River Water Management*.

The case centered on whether a Florida wetlands district could set excessive conditions on the approval of a land-use permit. In 1994, landowner Coy Koontz applied for a permit to develop a 3.7-acre section of his wetlands property. As required by state law, Mr. Koontz offered to compensate for any wetland damage by deeding an 11-acre easement to the district for conservation.

That wasn't enough for local regulators, who gave Mr. Koontz an ultimatum: He could scale back his development to one acre and surrender the rest of his property to the district. Or he could proceed with his project with the 11-acre easement and pay thousands to improve district land miles away that was unaffected by his development.

Mr. Koontz declined the offer and sued under a Florida law that allows monetary damages when an "unreasonable exercise of the state's police power" constitutes "a taking without just compensation." Florida's Supreme Court ruled that Mr. Koontz didn't have a claim since his permit had been denied. Ergo, his property was not actually taken. By this logic, a landowner must first succumb to government property extortion in order to have a case.

Writing for the 5-4 majority, Justice Samuel Alito reversed the state court on grounds that "extortionate demands for property in the land-use permitting context run afoul of the Takings Clause not because they take property but because they impermissibly burden the right not to have property taken without just compensation."

The ruling extends the Court's *Nollan* (1987) and *Dolan* (1994) Takings Clause precedents to government denial of permits and government demands for offsite mitigation rather than a direct invasion of private property. This is a big deal because governments find multiple ways to extort property.

Property cases don't get the media attention that free speech issues do, but the Constitution's bar against unjust takings remains a bedrock protection against government abuse. Now if only Justice Anthony Kennedy would revisit his vote tolerating the abuse of eminent domain in *Kelo v. City of New London*. It's not too late, sir.
